Not illustrated. 1736 Excerpt: ...as with the former; and so on in infinitum. The Quo tient therefore Is $j \dots + \dots$, &c. (or j into $i - I + j i - j i$, &c.) So that by this Operation the Number or Quantity $j q$, (or $1 x - f - x_I$) is reduced from that Scale in. Arithmetick whose Root is $b + x$, to an equivalent Number, the Root of whose Scale, (or whose converging quantity) is. And this Number, or infinite Series thus found, will converge so much the faster to the truth, as b is greater than x . To apply this, by way of illustration, to an instance or two in common Numbers. Suppose we had the Fraction f , and would reduce it from the septenary Scale, in which it now appears, to an equivalent Series, that shall converge by the Powers of 6. Then we shall have $j = \dots$ and therefore in the foregoing general Fraction j , make $a = r$, $\text{£} = 6$, and $x = i$, and the Series will become $f \dots f. 1 \dots \pm t$ Sec. which will be equivalent to 7. Or if we would reduce it to a Series converging by the Powers of 8, because $f = -f$, make $a = 5$, $b = 8$, and $v = -1$, then then $f = r + \dots - t - p + \dots + g$ tec. which Series will converge faster than the former. Or if we would reduce it to the common Denary. (or Decimal.) Scale, because $i = -T$, make $t a i j e i o$, and $X \dots -3 \gg t$ "en $T = = T7$ "4" Too "+" TooJ H Too o o' "+" To oTTTJT C« s= o, 1428, &c. as may be easily collected. And hence we may observe, that this or any other Fraction may be reduced a great variety of ways to infinite Series; but that Series will converge fastest to the truth, in which b shall be greatest in respect os x . But that Series will be most easily reduced to the common Arithmetick, which converges by the Powers of 10, or its Multiples. If we should here resolve 7 into the parts 3-4-4, or 2+-5, or 1-f-,6, &c. instead of conv...
